Underwater Radiated Noise Measurement and Management with KINETIX

KINETIX

IMPACT MONITORING TECHNOLOGY

Project Overview

Kinetix is a product and service package originally designed for shock and vibration monitoring of high speed craft

The system is under evaluation in a Transport Canada project to detect hull-induced vibrations due to propeller cavitation

The initial project focus is on small boats, trials on larger fishing vessels are upcoming

Project Overview

First trial on a small planing craft with a 150 hp outboard

Project Overview

Second trial on a planing craft with twin 200 hp outboards

Test Procedure

250 RPM steps from 700 to 4,000 RPM

3 craft load conditions:

Standard - **Free running**

Moderate – Towing sea anchors

High – Boat **tethered** to dock

Noise measurements in the enclosed aft hatch area ~20 Hz to 20 kHz

Dry side vibration measurements on the transom and hull

Hydrophone measurements (upcoming)

Results

Early Results

- 1) Cavitation observed, distinct from exhaust and aeration/ventilation
- 2) Cavitation onset observed on the leading blade edges
- 3) PSDs for free vs tethered non cavitating states were similar
- 4) PSDs indicate earlier cavitation onset with higher prop loading
- 5) PSDs indicate cavitation before it can be seen
- 6) Prop cavitating in normal use at high speed
- 7) PSDs suggest clearer differences at higher frequencies

Exhaust, no cavitation

Exhaust, no cavitation

Cavitation onset

Cavitation

Cavitation

Early Results

- 1) Cavitation observed, distinct from exhaust and aeration
- 2) Cavitation onset observed on the leading blade edges
- 3) PSDs for free vs tethered non cavitating states were similar
- 4) PSDs indicate earlier cavitation onset with higher prop loading
- 5) PSDs indicate cavitation before it can be seen
- 6) Prop cavitating in normal use at high speed
- 7) PSDs suggest clearer differences at higher frequencies

Leading edge cavitation onset

Leading edge cavitation onset

Early Results

- 1) Cavitation observed, distinct from exhaust and aeration
- 2) Cavitation onset observed on the leading blade edges
- 3) PSDs for free vs tethered non cavitating states were similar
- 4) PSDs indicate earlier cavitation onset with higher prop loading
- 5) PSDs indicate cavitation before it can be seen
- 6) Prop cavitating in normal use at high speed
- 7) PSDs suggest clearer differences at higher frequencies

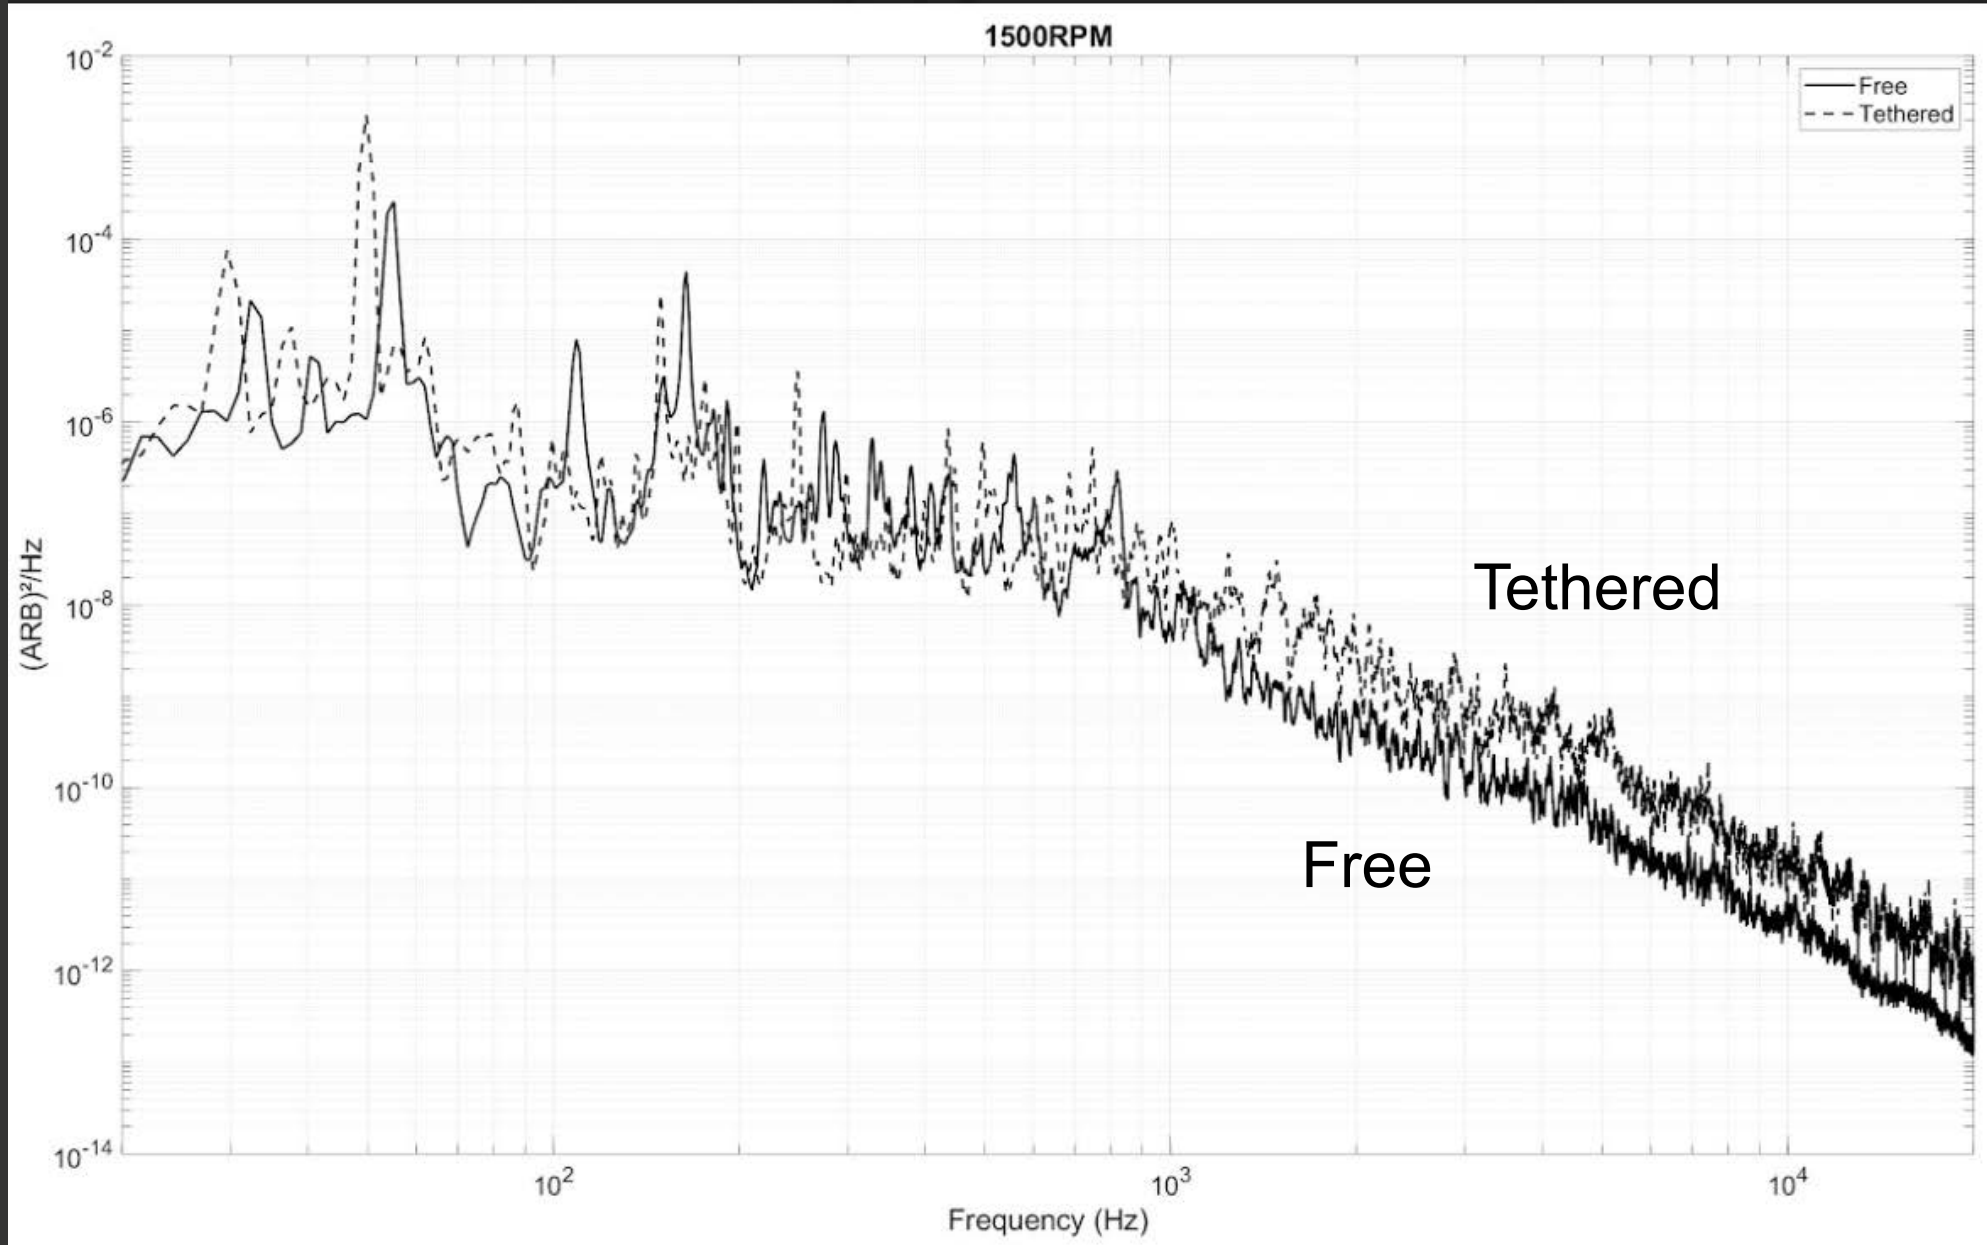

PSD 1250 RPM – No cavitation

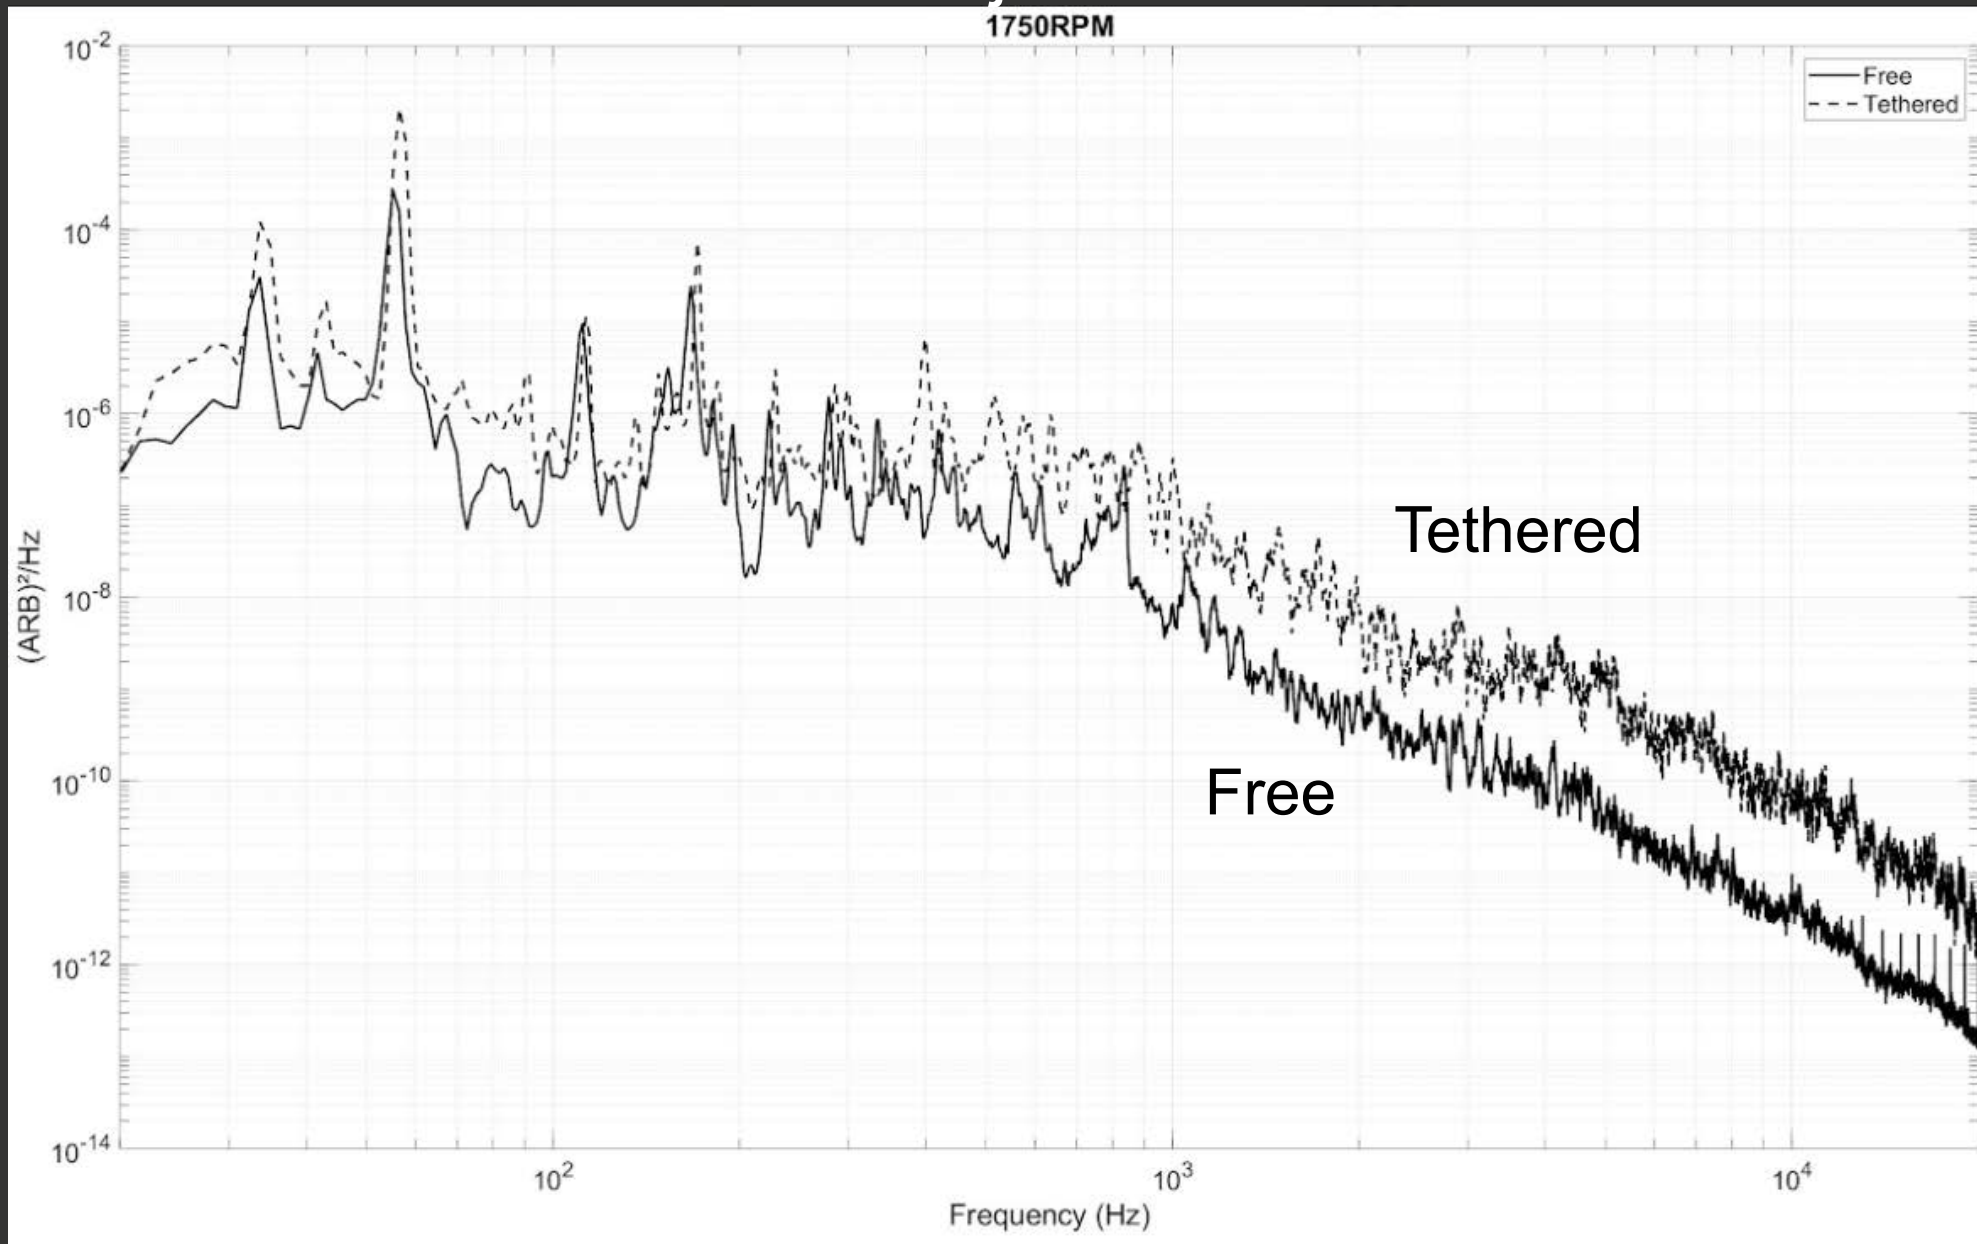

Early Results

- 1) Cavitation observed, distinct from exhaust and aeration
- 2) Cavitation onset observed on the leading blade edges
- 3) PSDs for free vs tethered non cavitating states were similar
- 4) PSDs indicate earlier cavitation onset with higher prop loading
- 5) PSDs indicate cavitation before it can be seen
- 6) Prop cavitating in normal use at high speed
- 7) PSDs suggest clearer differences at higher frequencies

PSD 1500 RPM – No cavitation visible

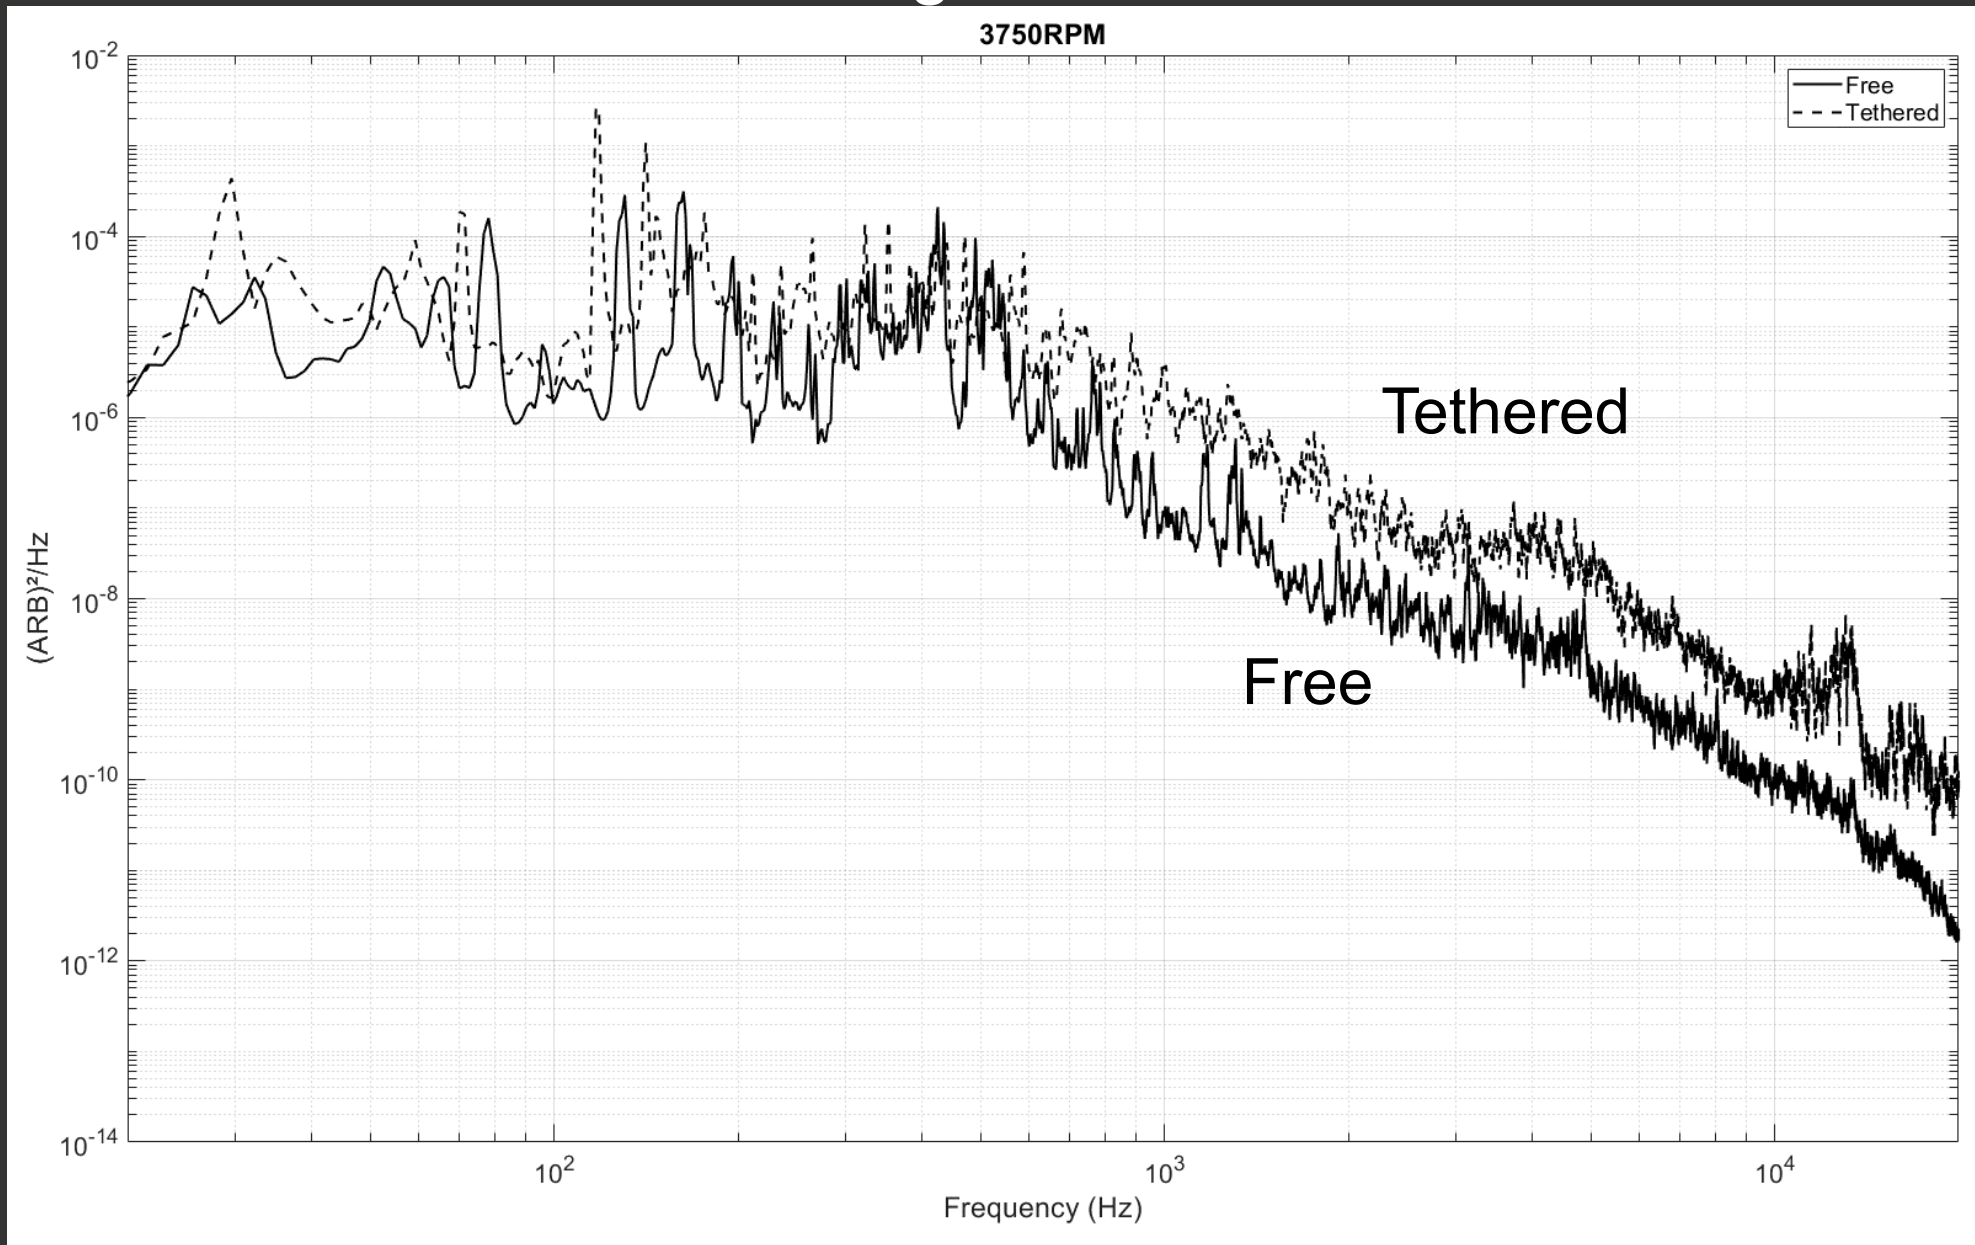

PSD 1750 RPM – Cavitation just visible

Early Results

- 1) Cavitation observed, distinct from exhaust and aeration
- 2) Cavitation onset observed on the leading blade edges
- 3) PSDs for free vs tethered non cavitating states were similar
- 4) PSDs indicate earlier cavitation onset with higher prop loading
- 5) PSDs indicate cavitation before it can be seen
- 6) Prop cavitating in normal use at high speed
- 7) PSDs suggest clearer differences at higher frequencies

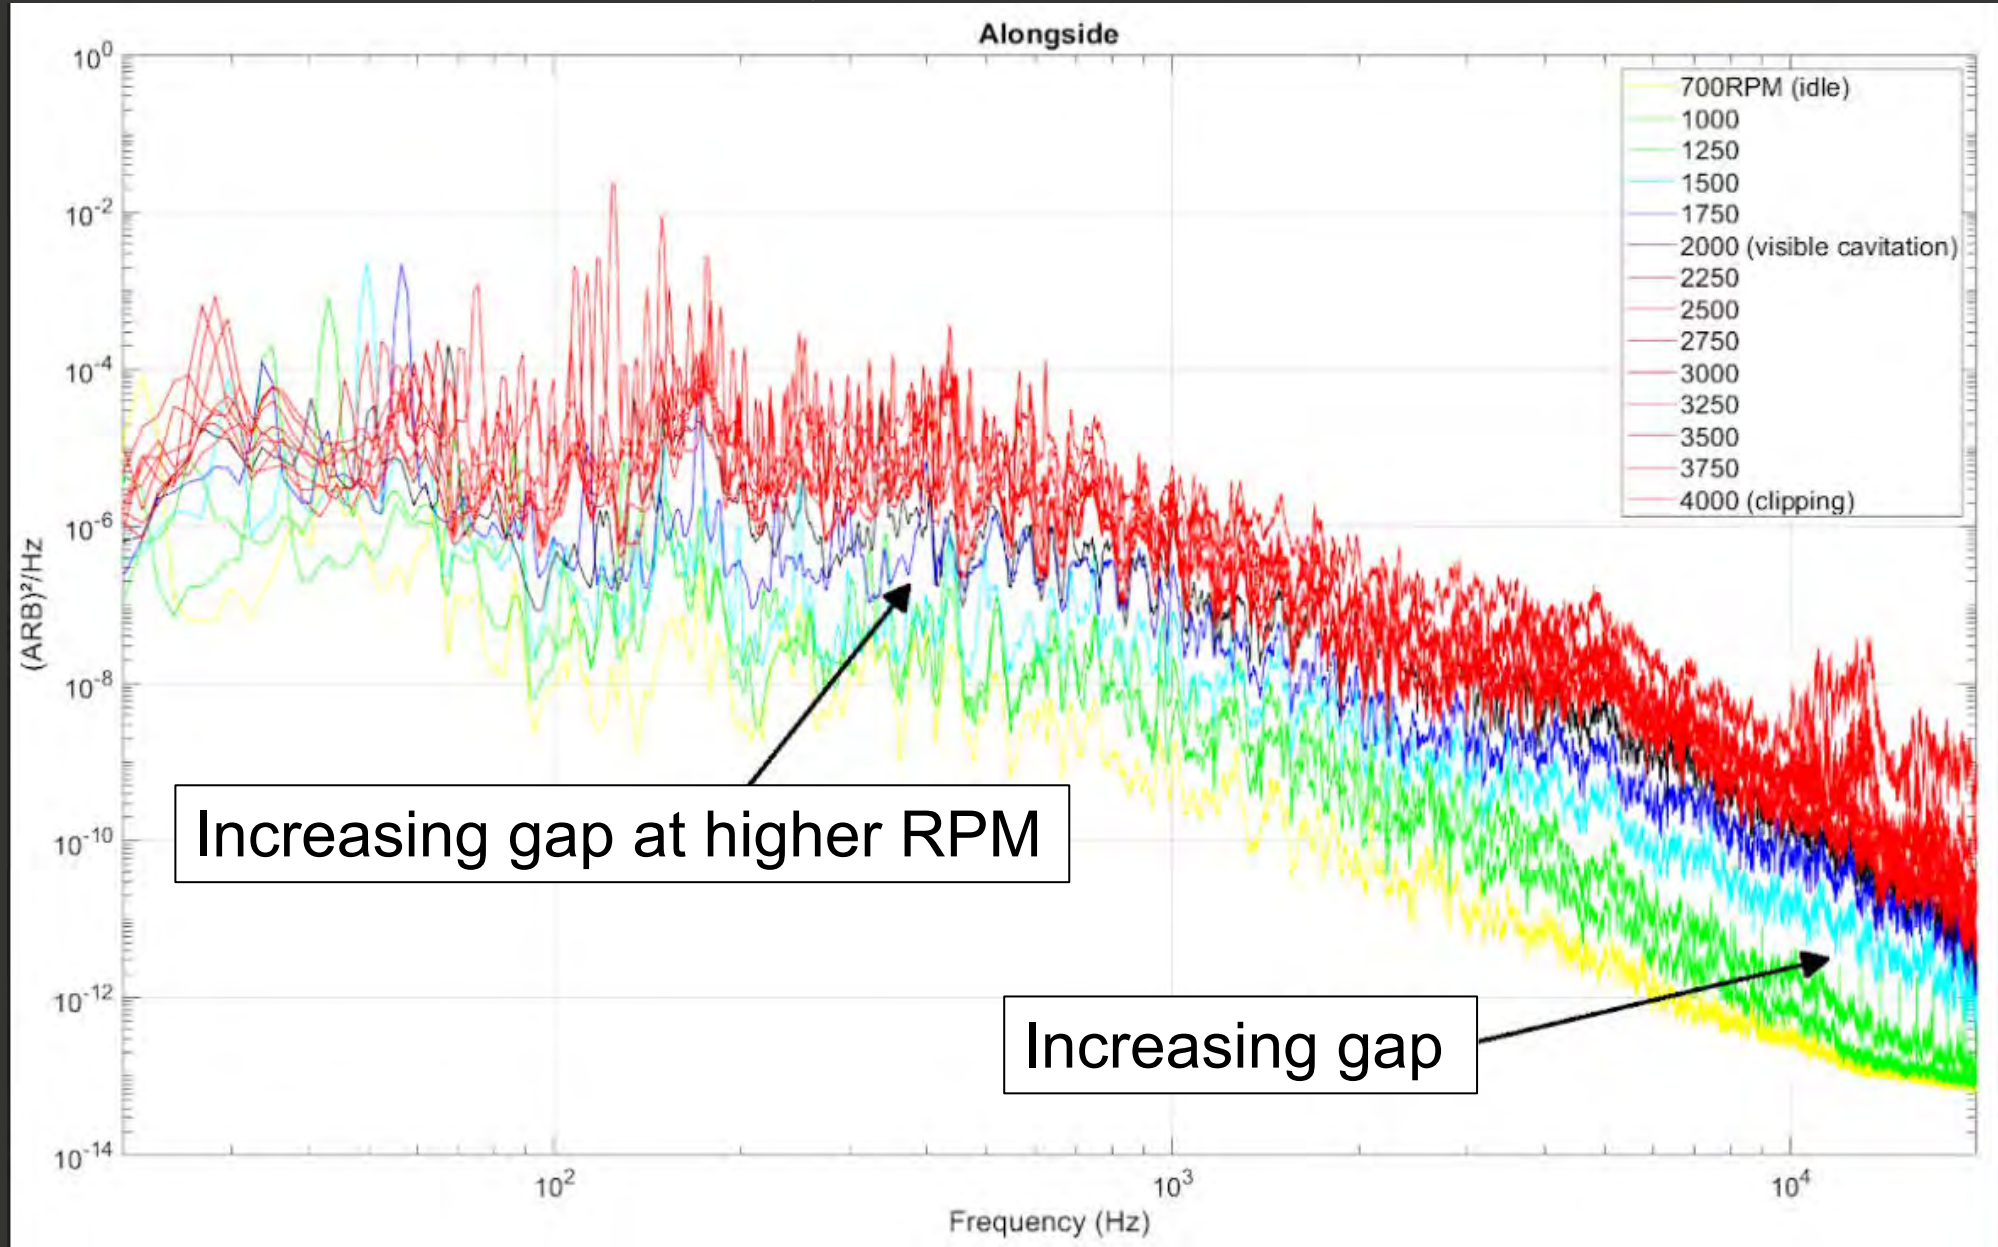

PSD 3750 RPM - Cavitating

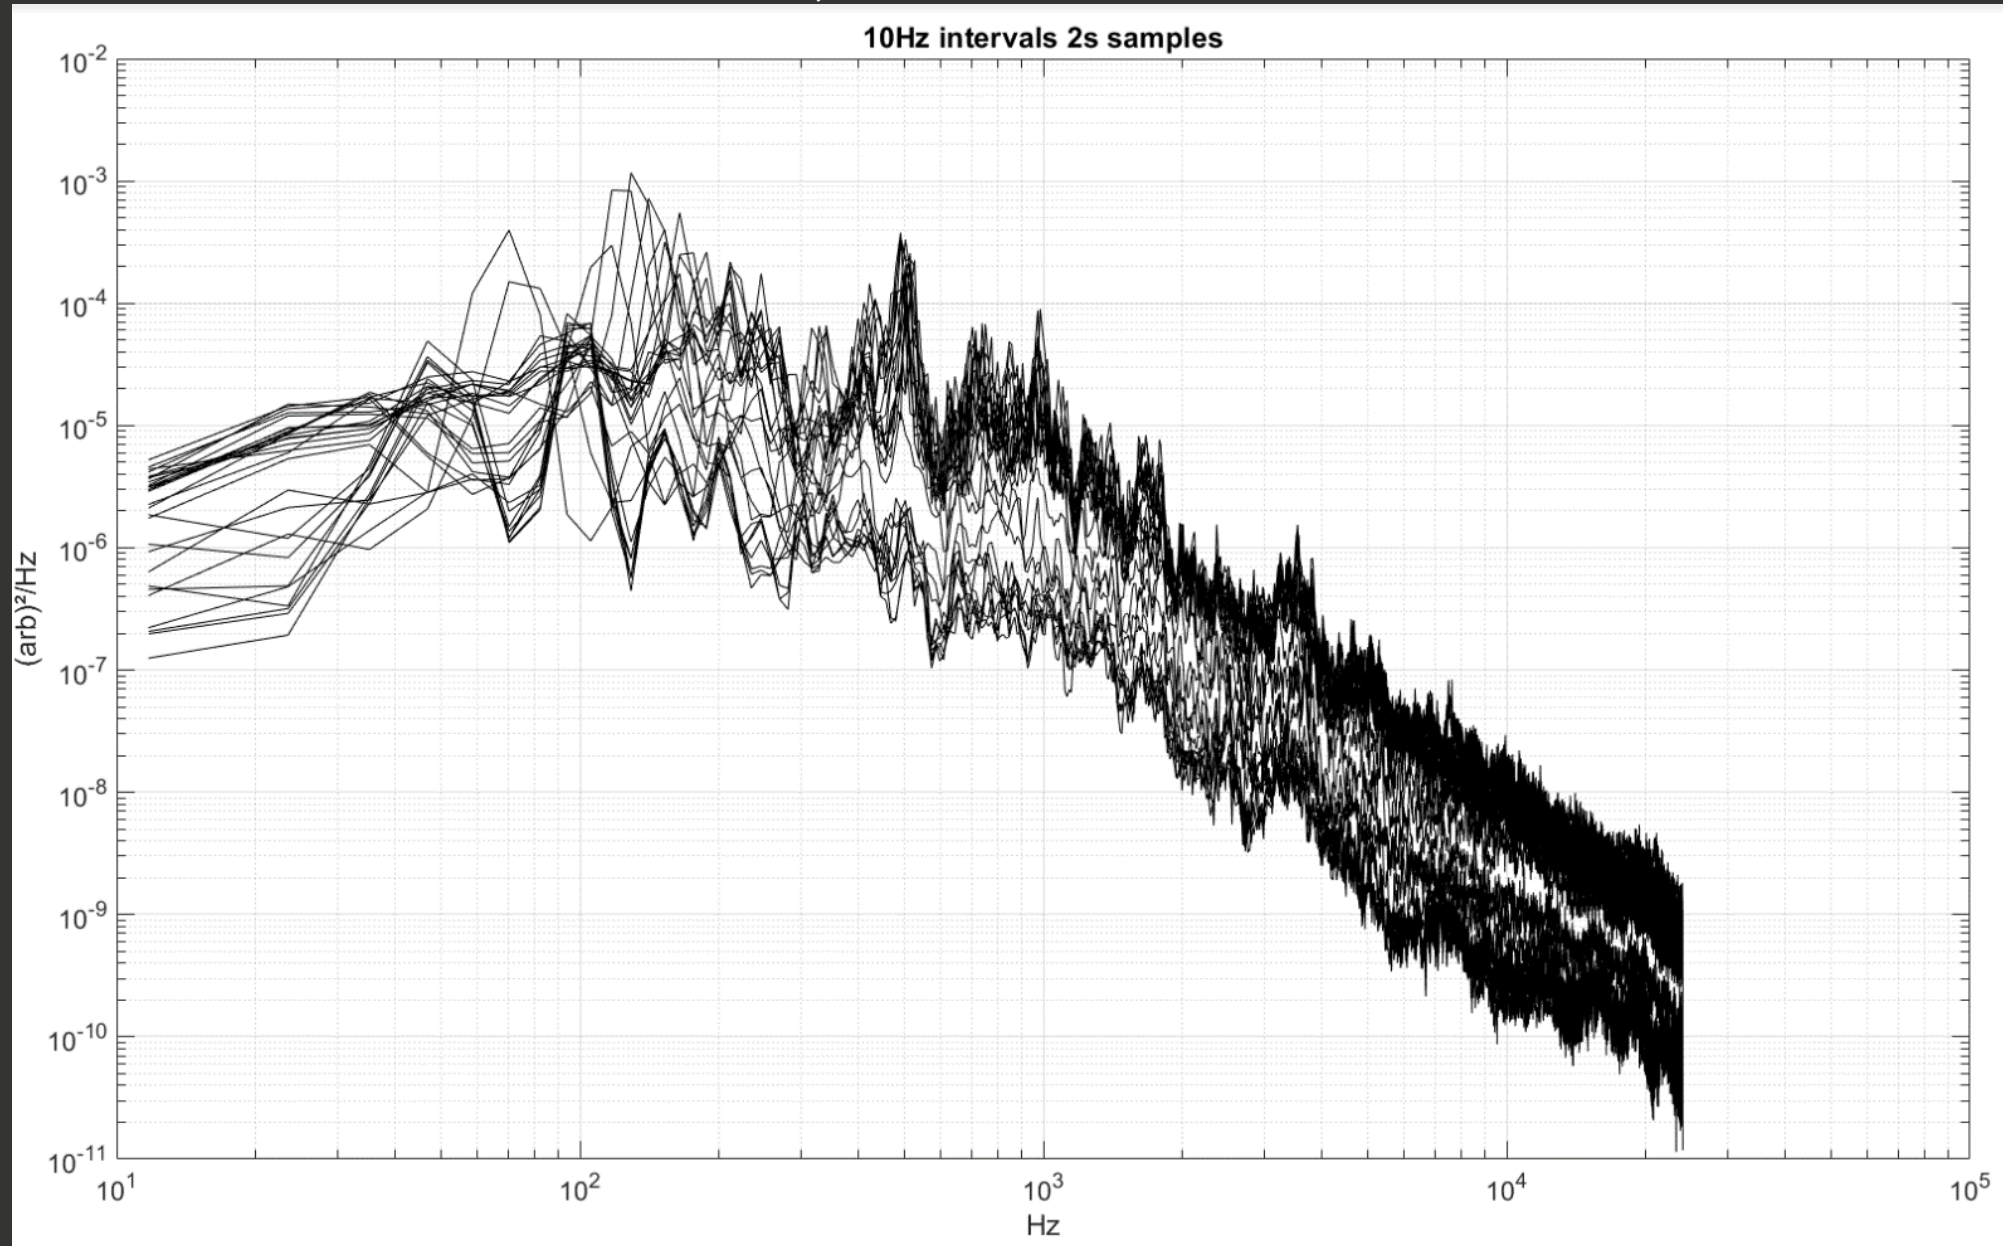

Early Results

- 1) Cavitation observed, distinct from exhaust and aeration
- 2) Cavitation onset observed on the leading blade edges
- 3) PSDs for free vs tethered non cavitating states were similar
- 4) PSDs indicate earlier cavitation onset with higher prop loading
- 5) PSDs indicate cavitation before it can be seen
- 6) Prop cavitating in normal use at high speed
- 7) PSDs suggest clearer differences at higher frequencies

PSD tethered condition, Trial 1

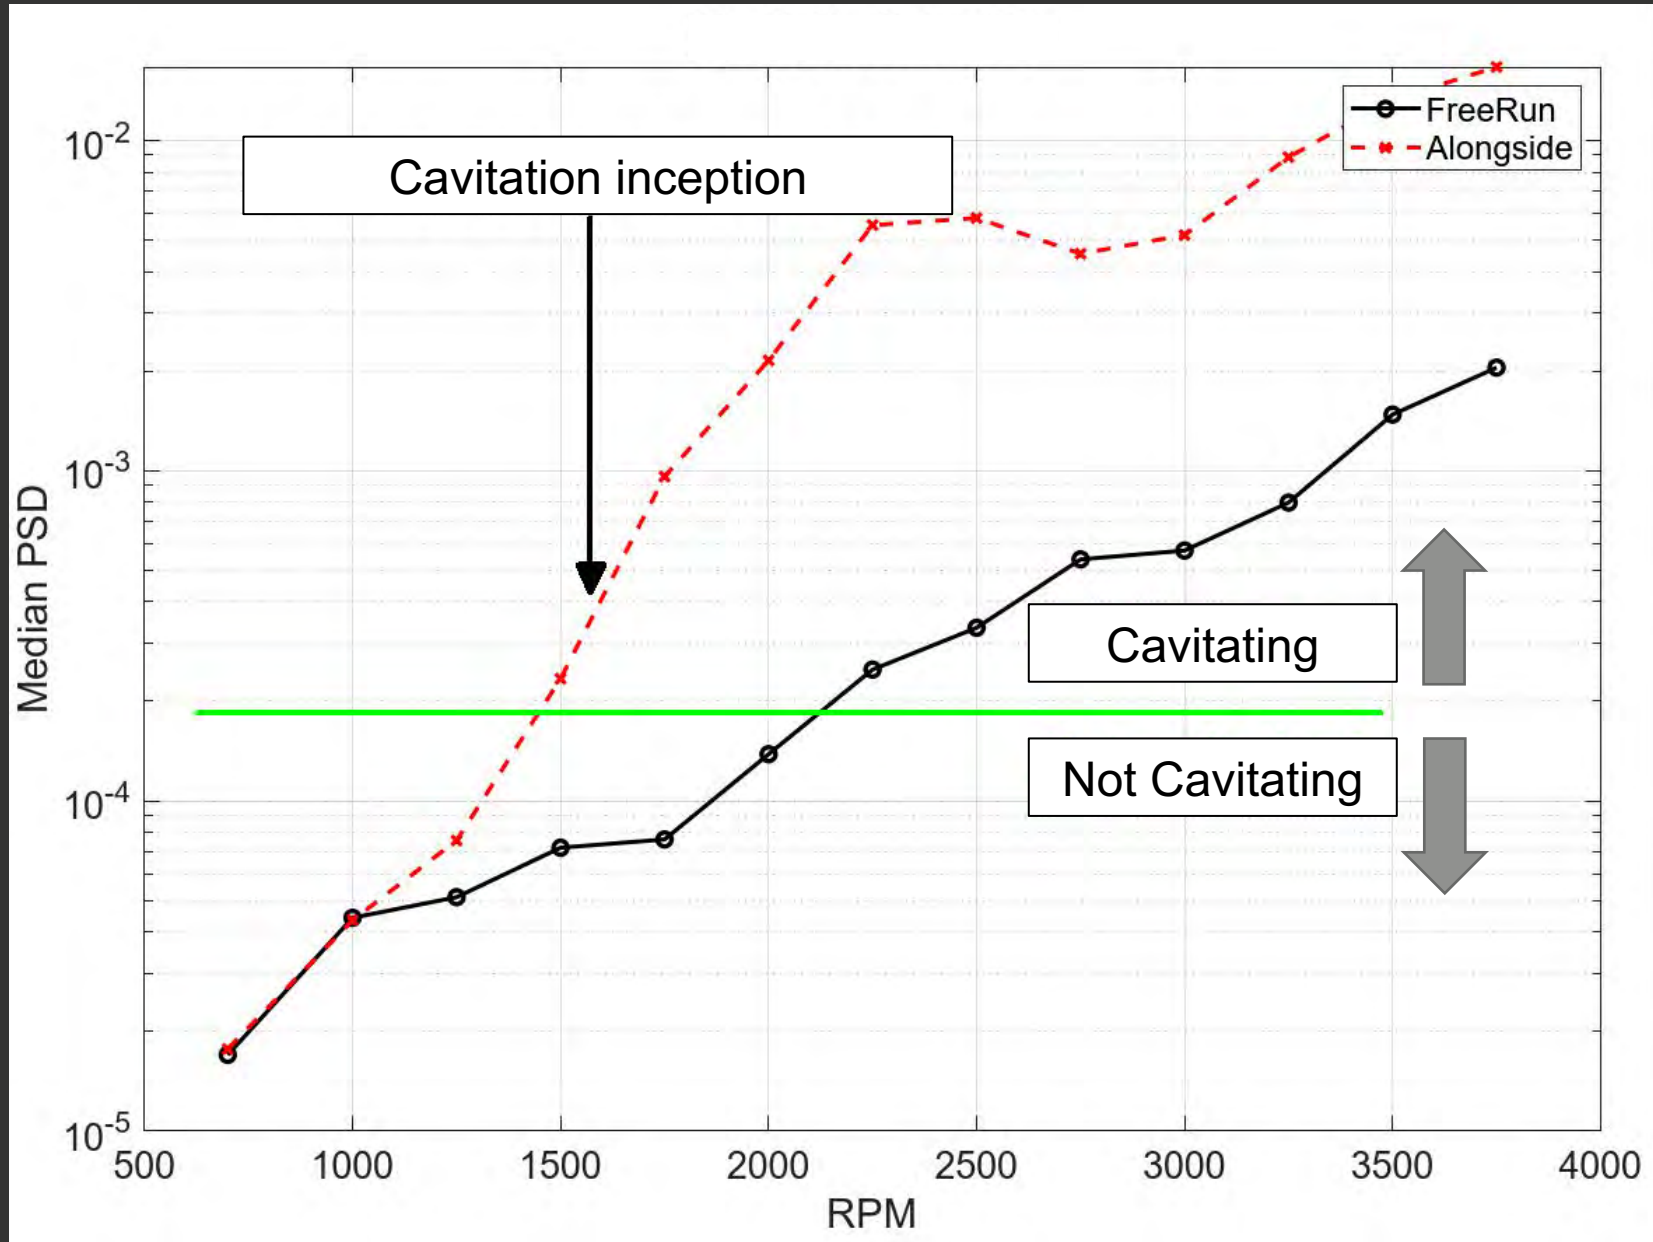

PSD tethered condition, Trial 2

Vibration Data

Hull vibration - tethered
